

1. Administrative & Study Identification

Full Study Title: A Phase III Open-Label Extension Study to Evaluate the Long-Term Safety of Astegolimab in Patients With Chronic Obstructive Pulmonary Disease **Short Title/Acronym:** ALNASA **Study Protocol Number:** GB43374 **NCT Number:** NCT05878769 **Sponsor Name:** Hoffmann-La Roche / Genentech, Inc. **Investigational Product:** Astegolimab (Anti-ST2 monoclonal antibody) **Phase of Development:** Phase III **Medical Monitor:** Head of CTRM Clinical Trial Regulatory Management, Product Development Regulatory (Hoffmann-La Roche)

2. Study Synopsis & Rationale

2.1 Study Objective Primary Objective: To assess the long-term safety and to explore the efficacy of astegolimab in participants with chronic obstructive pulmonary disease (COPD) who have completed the 52-week placebo-controlled treatment period in parent studies GB43311 (ALIENTO) or GB44332 (ARNASA). **Secondary Objectives:** To evaluate the long-term efficacy of astegolimab, specifically measuring the annualized rate of moderate or severe acute exacerbations of COPD (AECOPD), as well as changes in health-related quality of life, respiratory symptoms, and lung function.

2.2 Background & Rationale To address the significant disease burden and frequent exacerbations experienced by patients with COPD. Astegolimab is a fully human immunoglobulin G2 monoclonal antibody that binds with high affinity to the ST2 receptor, preventing the binding of the alarmin interleukin-33 (IL-33). IL-33 and ST2 are implicated in airway inflammation and COPD exacerbations. This open-label extension study (ALNASA) aims to evaluate the long-term safety, tolerability, and ongoing efficacy of astegolimab in combination with standard of care maintenance therapies for COPD patients rolling over from previous Phase 2b/3 trials.

3. Study Design & Methodology

3.1 Design Framework Study Type: Interventional (Open-Label Extension) **Control Type:** Single-arm **Blinding:** Open-label (None) **Randomization:** N/A

3.2 Planned Enrollment & Duration Target \$N\$: Estimated 2,000 participants **Number of Sites:** Approximately 483 locations

4. Subject Selection (Eligibility Criteria)

4.1 Inclusion Criteria 1. Completion of the 52-week placebo-controlled treatment period in either parent study GB43311 or GB44332. 2. Willingness to continue study participation and adhere to the protocol requirements.

4.2 Exclusion Criteria 1. Withdrawal of consent and/or premature discontinuation from the parent study. 2. Any permanent discontinuation of the study drug in the parent study. 3. Any new diagnosis of asthma according to the Global Initiative for Asthma guidelines since enrolling in the parent study. 4. Any new clinically significant pulmonary disease other than COPD (e.g., pulmonary fibrosis, sarcoidosis) or any new unstable cardiac disease/heart failure (NYHA Class III/IV) since enrolling in the parent study.

5. Intervention & Treatment Plan

5.1 Investigational Regimen Dosage/Frequency: Subcutaneous (SC) astegolimab administered every 2 weeks (Q2W). **Route of Administration:** Subcutaneous injection. **Duration of Treatment:** Up to approximately 4 years, until the end of the study, or until the drug is approved/commercially available.

5.2 Concomitant & Prohibited Therapy Permitted: Standard of care COPD maintenance therapies, including inhaled corticosteroids (ICS), long-acting beta-agonists (LABA), and long-acting muscarinic antagonists (LAMA). **Prohibited:** Other investigational drugs or non-approved biologics for respiratory conditions not cleared by the protocol.

6. Study Timeline & Visit Schedule

Visit ID	Window (Days)	Key Activities/Procedures	:---
:---	:---	Screening	Rollover Informed consent, verification of parent study completion, baseline safety checks
Treatment Visits	Every 2 Weeks	Subcutaneous injection of astegolimab (clinic or home administration), AE tracking	
Interim Follow-ups	Scheduled	Assessment of COPD exacerbations, lung function testing, quality of life questionnaires	
End of Study	EOS / +12 Weeks	Final treatment dose, exit assessments, and a post-treatment safety follow-up visit 12 weeks (3 months) later	

7. Outcome Measures (Endpoints)

7.1 Primary Endpoint Definition: Incidence of all adverse events (AEs) from the start of the extension study up to 12 weeks after the last dose of study treatment. **Measurement Method:** Clinical safety evaluation, laboratory monitoring, and vital signs assessment.

7.2 Secondary & Exploratory Endpoints * **Endpoint 1:** Annualized rate of moderate or severe acute exacerbations of COPD (AECOPD). * **Endpoint 2:** Changes in health-related quality of life and respiratory symptoms (e.g., SGRQ-C scores). * **Endpoint 3:** Changes in lung function parameters (e.g., FEV1).

8. Safety & Adverse Event Reporting

Adverse Event (AE) Monitoring: Standard reporting of treatment-emergent adverse events (TEAEs) at every bi-weekly visit, extending up to 12 weeks post-treatment. **Serious Adverse Events (SAEs):** Evaluated strictly per the protocol and reported typically within 24 hours of investigator awareness. **Data Monitoring Committee (DMC):** Governed centrally by the sponsor (Hoffmann-La Roche) to evaluate long-term cumulative safety signals for anti-ST2 pathway inhibition.

9. Statistical Analysis Plan (SAP) Summary

Analysis Populations: Safety Set consisting of all participants who receive at least one dose of open-label astegolimab in the extension phase. **Sample Size Justification:** The target sample size of approximately 2,000 is based on the expected number of eligible patients successfully completing the 52-week treatment period in parent studies GB43311 and GB44332. **Handling of Missing Data:** Standard handling aligned with open-label safety reporting, prioritizing descriptive summarization of safety incidents.

10. Quality Assurance & Regulatory Compliance

GCP Compliance: This study will be conducted in accordance with Good Clinical Practice (GCP) and the Declaration of Helsinki. **Monitoring Plan:** Regular site visits, remote monitoring, and direct oversight by CTRM Clinical Trial Regulatory Management. **Audit Trail:** Robust centralized data capture through clinical site eCRFs with thorough query resolution and data clarification procedures.

11. Study Identifiers & Governance

Primary ID: GB43374 **Registry Number:** NCT05878769 **Sponsor/Lead Organization:** Hoffmann-La Roche **Study Title:** ALNASA Study
Official Regulatory Title: A Phase III Open-Label Extension Study to evaluate the long-term safety of Astegolimab in patients with chronic obstructive pulmonary disease

12. Clinical Framework (Astegolimab Specific)

Primary Condition: Chronic Obstructive Pulmonary Disease (COPD)
Diagnosis Threshold: Diagnosis of COPD with a history of frequent exacerbations
Medical Methodology: Anti-ST2 monoclonal antibody therapy targeted at the IL-33 inflammatory cascade
Optimization Target: Sustained reduction in the annualized rate of COPD exacerbations and improvement in respiratory symptoms

13. Study Procedures & Methodology

Management Pathway: Long-term biologic maintenance combined with standard of care respiratory inhalers
Education Protocol (HCP): Site investigator training for open-label extension rollover and safety surveillance
Education Protocol (Patient): Open-label consent, disease symptom diary keeping, and potentially home-administration training for subcutaneous injections
Quality Audit Mechanism: Routine compliance monitoring and safety tracking by the sponsor

14. Observation & Follow-Up Schedule

Total Duration: Up to 4 years of treatment + 12 weeks safety follow-up
Onsite Visit Cadence: Dosing every 2 weeks (Q2W); some dosing may occur via home administration
Remote Monitoring Frequency: Intermittent monitoring based on site/investigator setup and protocol scheduling
Checklist Review Interval: AEs, SAEs, and concomitant medications checked at every bi-weekly contact

15. Sign-off & Approval
