

1. Administrative & Study Identification

Full Study Title: AQUALIS: Quality of Life of Patients With Chronic Lymphocytic Leukemia Treated With Acalabrutinib in France: a Retrospective Observational Study Based on Data Extracted From the PLATON Database **Short Title/Acronym:** AQUALIS
Protocol Number: D8220R00057
NCT Number: NCT06548152
Sponsor Name: AstraZeneca
Investigational Product: Acalabrutinib (Calquence®, ACP-196)
Phase of Development: Observational / N/A for Retrospective Study
Medical Monitor: AstraZeneca Clinical Study Information Center

2. Study Synopsis & Rationale

2.1 Study Objective Primary Objective: To describe the Quality of Life (QoL) of treatment-naïve Chronic Lymphocytic Leukemia (CLL) patients treated with acalabrutinib between treatment initiation and 12 months after, in a real-life setting based on the PLATON database. **Secondary Objectives:** To describe patient demographic and disease characteristics, treatment patterns, disease status over time, and evaluate the evolution of treatment compliance (observance).

2.2 Background & Rationale CLL is the most prevalent leukemia among adults and is a chronic condition requiring long-term treatment. Patients with CLL often experience worse QoL than the general population across several domains, including physical functioning and symptoms like fatigue. While acalabrutinib has shown great efficacy and a favorable safety profile in clinical trials, QoL is often not assessed in real-world studies. Because acalabrutinib is an oral treatment that can potentially allow patients to continue living a normal life at home, this study is being conducted to evaluate its real-world impact on patients' QoL using the PLATON database.

3. Study Design & Methodology

3.1 Design Framework Study Type: Observational (Retrospective cohort study based on data from the PLATON database) **Control Type:** Single-arm **Blinding:** Open-label / N/A (Retrospective)
Randomization: N/A

3.2 Planned Enrollment & Duration Target \$\$\$: 120 patients **Number of Sites:** Multicenter (France, using PLATON database) **Estimated**

4. Subject Selection (Eligibility Criteria)

- 4.1 Inclusion Criteria** 1. Patient enrolled in the PLATON database. 2. Patient \$\\ge 18\$ years old. 3. Treatment-naïve CLL patient treated with acalabrutinib (as monotherapy or combined with Obinutuzumab) in a real-life setting. 4. Patient who does not object to their health data collected in the PLATON study being re-used for analysis/research purposes (Patients who started acalabrutinib but discontinued before 12 months are also included if full baseline data is available).
- 4.2 Exclusion Criteria** 1. Pregnant women. 2. Patients under protection of justice. 3. Patients over the age of 18 and unable to express their non-opposition. 4. Patients with prior CLL treatments.
-

5. Intervention & Treatment Plan

- 5.1 Investigational Regimen Dosage/Frequency:** Acalabrutinib monotherapy or in combination with Obinutuzumab, administered as per routine real-world clinical practice. **Route of Administration:** Oral **Duration of Treatment:** 12 months of follow-up from treatment initiation.
- 5.2 Concomitant & Prohibited Therapy Permitted:** Standard real-world concomitant medications for CLL and existing comorbidities as recorded in the PLATON database. **Prohibited:** Prior targeted therapies or chemo-immunotherapies (CIT) for CLL (patients must be treatment-naïve).
-

6. Study Timeline & Visit Schedule

Note: As this is a retrospective database study, "visits" represent data extraction points.

Visit ID	Window	Key Activities/Procedures	:---	:---
:---	Baseline (T0)	Month 0	Patient characteristics,	
			baseline QoL assessment (EORTC QLQ-C30 & QLQ-CLL17)	Interim 1
	Month 3	QoL assessment, compliance via GIRERD grid, disease status	Interim 2	Month 6
			QoL assessment, compliance via GIRERD grid, disease status	Interim 3
			QoL assessment, compliance via GIRERD grid, disease status	End of Study
	Month 12	Final QoL assessment, final compliance evaluation, disease status		

7. Outcome Measures (Endpoints)

7.1 Primary Endpoint Definition: Change (including improvement) in the Quality of Life (QoL) of patients over time between treatment initiation and 12 months. **Measurement Method:** EORTC QLQ-C30 standardized questionnaire.

7.2 Secondary & Exploratory Endpoints 1. Specific CLL Quality of Life measured using the QLQ-CLL17 (a supplementary module to the QLQ-C30 specifically designed for CLL). 2. Evolution of treatment compliance (observance) measured using the standardized GIRERD grid. 3. Descriptive patient characteristics, treatment patterns, and disease status over time.

8. Safety & Adverse Event Reporting

Adverse Event (AE) Monitoring: Standard retrospective pharmacovigilance based on real-world data recorded in the PLATON database. **Serious Adverse Events (SAEs):** Evaluated retrospectively as captured by healthcare providers in the source database. **Data Monitoring Committee (DMC):** N/A (Retrospective observational database study).

9. Statistical Analysis Plan (SAP) Summary

Analysis Populations: All included treatment-naïve patients (N=120) with a complete baseline assessment (T0). **Sample Size Justification:** A sample size of 120 patients provides enough power to detect a change (including an improvement) in patient QoL over time using the EORTC-QLQ-C30. **Handling of Missing Data:** A descriptive analysis will be conducted on all variables for which data have been extracted for the overall study population and sub-groups of interest. No specific imputations are strictly defined due to the retrospective nature.

10. Quality Assurance & Regulatory Compliance

GCP Compliance: This study is conducted in compliance with appropriate regulatory and ethics local approvals for a retrospective study in France. Patients eligible for the PLATON database sign specific informed consent for data re-use. **Monitoring Plan:** No specific active monitoring visits; data quality relies on the validated government-backed PLATON database. **Audit Trail:** Standard data extraction and database lock protocols applied to the PLATON database before analysis.

11. Study Identifiers & Governance

Primary ID: D8220R00057 **Registry Number:** NCT06548152 **Sponsor/Lead Organization:** AstraZeneca **Study Title:** AQUALIS **Official Regulatory Title:** AQUALIS: Quality of Life of Patients With Chronic Lymphocytic Leukemia Treated With Acalabrutinib in France: a Retrospective Observational Study Based on Data Extracted From the PLATON Database

12. Clinical Framework (CLL Specific)

Primary Condition: Chronic Lymphocytic Leukemia (CLL) **Diagnosis Threshold:** Confirmed CLL, treatment-naïve requiring first-line treatment **Medical Methodology:** Real-world targeted therapy (BTK inhibitor) **Optimization Target:** Quality of Life (QoL) maintenance/improvement and treatment compliance

13. Study Procedures & Methodology

Management Pathway: Routine real-world clinical practice in France for CLL **Education Protocol (HCP):** N/A (Retrospective observational study) **Education Protocol (Patient):** N/A (Retrospective observational study) **Quality Audit Mechanism:** Assessment of treatment compliance (observance) tracking using the standardized GIRERD grid

14. Observation & Follow-Up Schedule

Total Duration: 12 Follow-up months **Onsite Visit Cadence:** N/A (No extra visits required; database extraction at Months 0, 3, 6, 9, 12) **Remote Monitoring Frequency:** N/A (Retrospective extraction) **Checklist Review Interval:** QoL questionnaires (EORTC-QLQ-C30, QLQ-CLL17) and GIRERD grid assessed every 3 months (Q3M)

15. Sign-off & Approval
