Short Title:	A Study of Efficacy and Safety of Ianalumab Versus Placebo in Addition to Eltrombopag in Primary Immune Thrombocytopenia Patients Who Failed Steroids
Protocol Number:	909968739552549681
NCT Number:	NCT05653219

2. Study Synopsis & Rationale

2.1 Study Objective

Primary Objective:	1. Time from randomization until treatment failure: Time from randomization until treatment failure is defined as the time from randomization date until the first of the following events indicative of treatment failure: * platelet count below 30 G/L * start of a new ITP treatment * need for a rescue treatment * ineligibility to taper or inability to discontinue eltrombopag * death
Secondary Obj.:	1. Stable response at 6 months 2. Complete Response rate at each timepoint 3. Response rate at each timepoint

2.2 Background & Rationale

The purpose of this study is to evaluate the effect of two different doses of Ianalumab added to eltrombopag to prolong Time to Treatment Failure (TTF) in adults with primary ITP who failed previous first-line treatment with steroids.
