

Clinical Study Summary Report (CSSR)

Document Status: Final | Version: 1.0 | Date: 01-APR-2026

1. Administrative & Study Identification

Full Study Title:	A Randomized, Double-blind, Placebo-controlled, Japan Local Phase II Clinical Study Comparing Eltrombopag Monotherapy Versus Placebo in Adult Lower-risk Myelodysplastic Syndromes (MDS) Patients With Platelet Transfusion Dependence
Short Title:	Study of Efficacy and Safety of Eltrombopag in Lower-risk MDS Patients With Platelet Transfusion Dependence
Protocol Number:	456764293526330337
NCT Number:	NCT04797000
Sponsor Name:	Novartis
Investigational Product:	eltrombopag
Phase:	PHASE2
Medical Monitor:	[Not Provided in Posting]

2. Study Synopsis & Rationale

2.1 Study Objective

Primary Objective:	1. Percentage of participants who achieve platelet transfusion independence at Week 24: Platelet transfusion independence is defined as the absence of platelet transfusion for at least 8 weeks. Platelet count should be higher than the baseline count.
Secondary Obj.:	1. Time to platelet transfusion independence 2. Duration of platelet transfusion independence 3. Percentage of participants with platelet transfusion independence

2.2 Background & Rationale

This study is designed to evaluate the efficacy and safety of eltrombopag monotherapy in Japanese adult patients with platelet transfusion-dependent lower-risk Myelodysplastic syndromes (LR-MDS).

3. Study Design & Methodology

Design Framework:	Type: INTERVENTIONAL, Phase: PHASE2, Status: ACTIVE_NOT_RECRUITING
Target N:	36

4. Subject Selection (Eligibility Criteria)

4.1 Inclusion Criteria

* Patients diagnosed with MDS according to the WHO classification revised 4th edition by investigator assessment with one of the following prognostic risk categories, based on the International

Prognostic Scoring System (IPSS-R):

* very low (0-1.5)

Clinical Study Summary Report (CSSR)

Document Status: Final | Version: 1.0 | Date: 01-APR-2026

- * low (2-3)
- * intermediate risks (3.5-4.5) All following criteria for prognostic variables per IPSS-R should be met.
- * Bone marrow blast $\leq$ 5% (per both investigator's assessment and central review)
- * Cytogenetic very good, good or intermediate risk corresponding to IPSS-R
- * Platelet transfusion dependence
- * Refractory, intolerant to, or ineligible for MDS treatments
- * Eastern Cooperative Oncology Group (ECOG) Performance status (PS) 0 or 1

4.2 Exclusion Criteria

- * Patients with a history of prior administration of eltrombopag, romiplostim, or other TPO-RA
- * Therapy-related MDS per WHO classification revised 4th edition
- * MDS/myeloproliferative neoplasms including chronic myelomonocytic leukaemia per the WHO classification revised 4th edition
- * MDS with excess blasts (EB) per WHO classification revised 4th edition
- * Known history of IPSS-R high or very high risk MDS
- * Currently receiving treatments for MDS (e.g., HMA, cyclosporine A (CsA) or lenalidomide). Supportive treatment with erythropoiesis-stimulating agents (ESAs) in anemic patients or granulocyte-colony stimulating factor (G-CSF) in patients with severe neutropenia and recurrent infections is allowed if at stable dosage for 3 months prior to screening and continued at the same dosing/schedule until the optimal dose of eltrombopag has been established.
- * Patients scheduled for hematopoietic stem cell transplantation
- * Bone marrow fibrosis that leads to an inability to aspirate adequate bone marrow sample
- * Known thrombophilic risk factors (except in cases where potential benefits of participating in the study outweighed potential risks of thromboembolic events (TEE), as determined by the investigator)

Other protocol-defined inclusion/exclusion criteria may apply.

11. Study Identifiers & Governance

Primary ID: 456764293526330337

Registry Number: NCT04797000

Sponsor: Novartis

Study Title: Study of Efficacy and Safety of Eltrombopag in Lower-risk MDS Patients With Platelet Transfusion Dependence

15. Sign-off & Approval
