

Clinical Study Summary Report (CSSR)

Document Status: Final | Version: 1.0 | Date: 01-APR-2026

1. Administrative & Study Identification

Full Study Title:	A Prospective, Multi-center Observational Study Characterizing Clinical Outcomes of Patients Receiving Abrocitinib for Moderate-to-severe Atopic Dermatitis Who Had an Inadequate Response (or Intolerance) to ≥2 Previous Biologic Therapies Approved for Moderate-to-severe Atopic Dermatitis
Short Title:	Real World Efficiency of Abrocitinib Treatment at Patients With Moderate to Severe Atopic Dermatitis Who Had Inadequate Response to Previous Biologic Therapies.
Protocol Number:	1050492054222593935
NCT Number:	NCT06899204
Sponsor Name:	Pfizer
Investigational Product:	abrocitinib
Phase:	Not Applicable
Medical Monitor:	[Not Provided in Posting]

2. Study Synopsis & Rationale

2.1 Study Objective

Primary Objective:	1. Percentage of patients achieving EASI-75 improvement from baseline at Week 16 after index date: EASI evaluates severity of participant's AD (excluded scalp, palms, soles) based on severity of AD clinical signs and % of body surface area (BSA) affected. Severity of clinical signs of AD (erythema, induration/papulation, excoriation and lichenification) scored separately for each of 4 body regions(head and neck, upper limbs, trunk \[including axillae and groin\] and lower limbs \[including buttocks\]) on 4-point scale: 0= absent; 1= mild; 2= moderate; 3= severe. EASI area score was based upon % BSA with AD in each 4 body region: 0 (0%), 1 (>0 to <10%), 2 (10 to <30%), 3 (30 to <50%), 4 (50 to <70%), 5 (70 to <90%) and 6 (90 to 100%). Total EASI score = $0.1 \times A_h \times (E_h + I_h + Ex_h + L_h) + 0.2 \times A_u \times (E_u + I_u + Ex_u + L_u) + 0.3 \times A_t \times (E_t + I_t + Ex_t + L_t) + 0.4 \times A_l \times (E_l + I_l + Ex_l + L_l)$; A = EASI area score; E = erythema; I = induration/papulation; Ex = excoriation; L = lichenification; h = head and neck; u = upper limbs; t = trunk; l = lower limbs. Total EASI score ranged from 0.0 to 72.0, higher scores = greater severity of AD 2. Percentage of patients achieving ≥ 4-point improvement in Peak Pruritus Numerical Rating Scale (PP-NRS) collected daily all through the study from baseline at Week 2 by e-diary assessment: The severity of itch (pruritus) due to AD was assessed using a horizontal NRS. Participants at specified time points were asked the following question: "How would you rate your itch due to AD at the worst moment during the previous 24 hours?" The scale ranged from 0-10, where 0= no itch and 10= worst itch imaginable. Higher scores indicated worse itch.
Secondary Obj.:	1. Percentage of patients achieving EASI-75, 90 and 100 from baseline at Week 4 and 16 after index date 2. Percentage of patients achieving v-IGA response of Clear (0) or

Clinical Study Summary Report (CSSR)

Document Status: Final | Version: 1.0 | Date: 01-APR-2026

Almost Clear (1) and ? 2 points improvement from baseline at Week 4 and 16 after index date 3. Change from baseline in total percentage of BSA at week 4 and 16

2.2 Background & Rationale

This is a prospective, multi-center observational study characterizing clinical and patient reported outcomes of patients receiving abrocitinib for moderate-to-severe atopic dermatitis (M2S AD) who had inadequate response (or intolerance) to ?2 previous biologic therapies approved for M2S AD in the United States.

3. Study Design & Methodology

Design Framework: Type: OBSERVATIONAL, Status: NOT_YET_RECRUITING
Target N: 150

4. Subject Selection (Eligibility Criteria)

4.1 Inclusion Criteria

Not Provided

4.2 Exclusion Criteria

Not Provided

11. Study Identifiers & Governance

Primary ID: 1050492054222593935
Registry Number: NCT06899204
Sponsor: Pfizer
Study Title: Real World Efficiency of Abrocitinib Treatment at Patients With Moderate to Severe Atopic Dermatitis Who Had Inadequate Response to Previous Biologic Therapies.
